## Linking Open CV with Visual studio

**Author: Palani K**

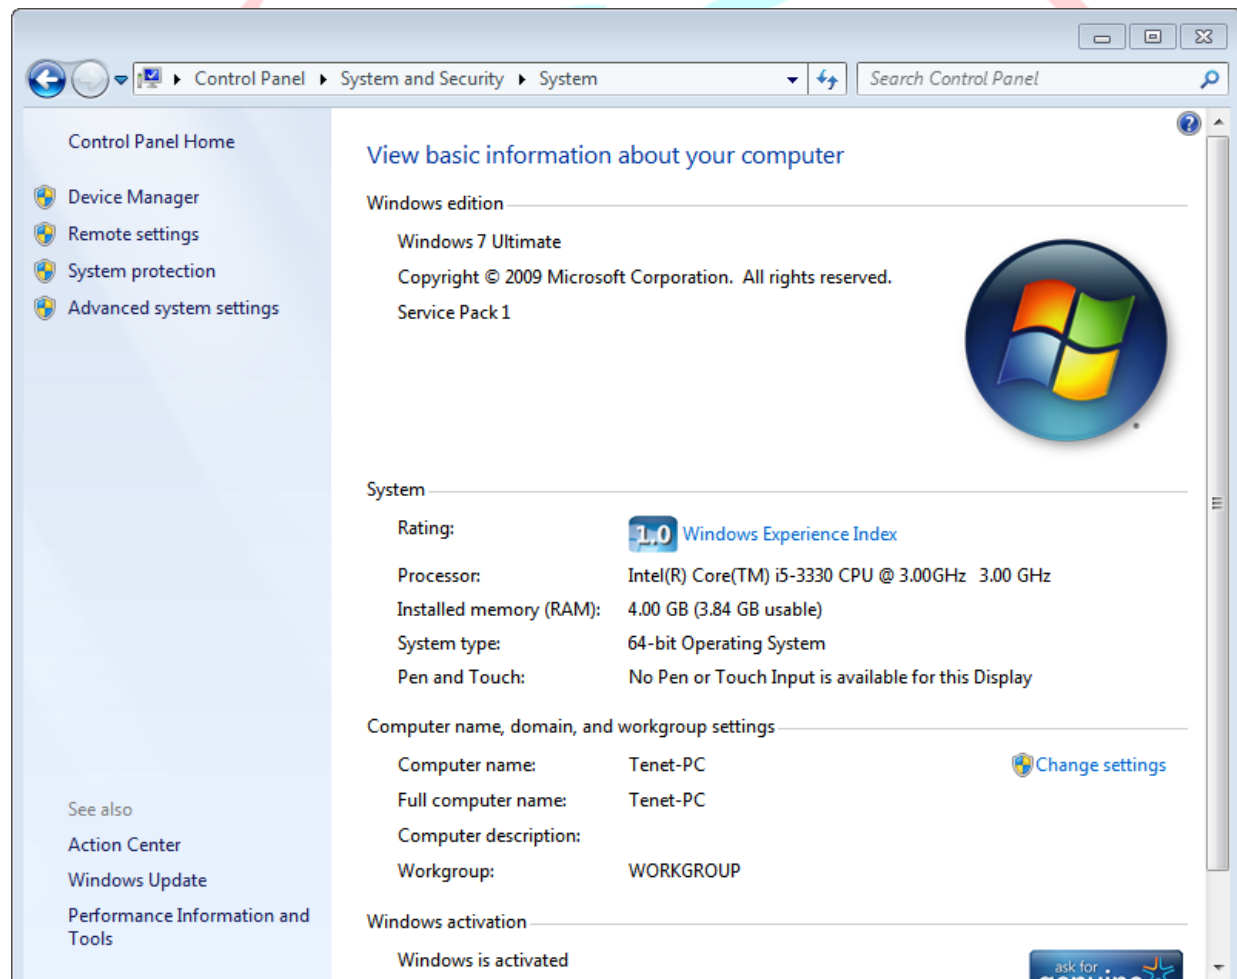

## Introduction:

In this article I'm going to guide you how to link Open CV with Visual studio 2013. OpenCV is a real time image processing tool which helps to perform operation on image and video. As you all know Matlab which is also a image processing tool. Now the question will raise why we go for Open CV rather than using MATLAB. The answer is, it is open source and faster compared to MATLAB.

## Steps for linking Open CV with Visual studio:

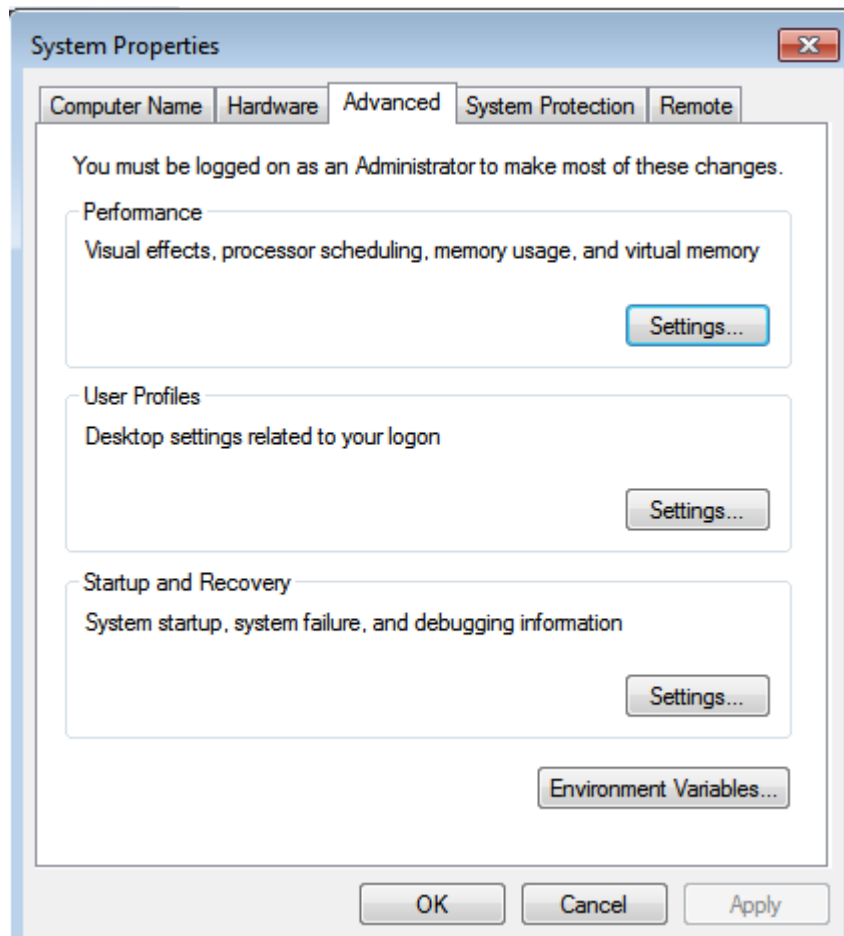

### Step 1:

Open system properties on your computer.

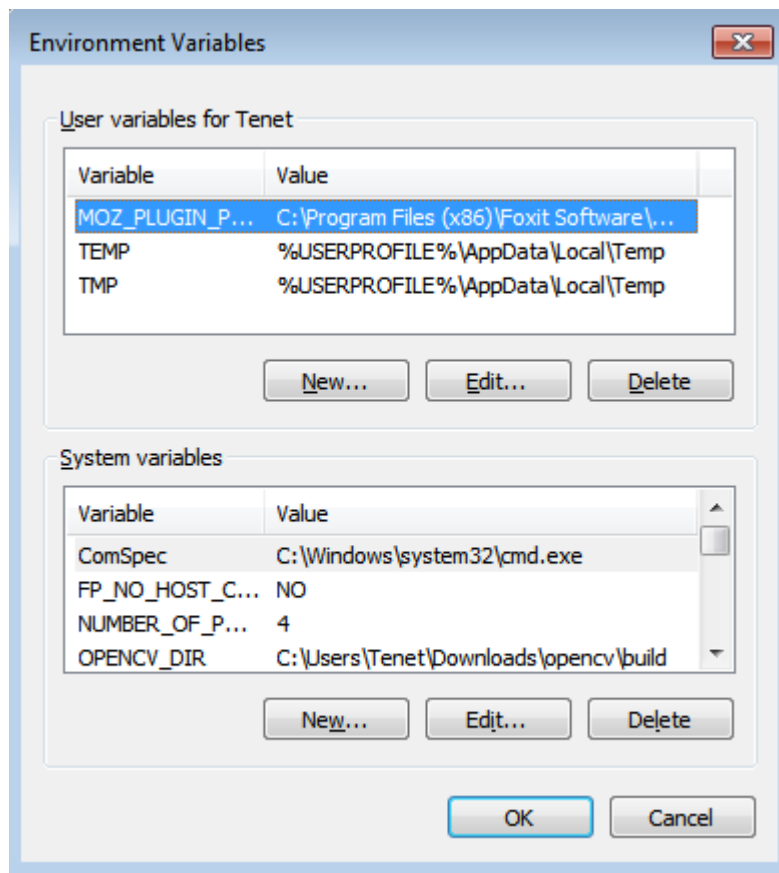

Step 2:

Select the Advanced system setting on left corner .

Step 3:

Select the Environment Variables on bottom of the window.

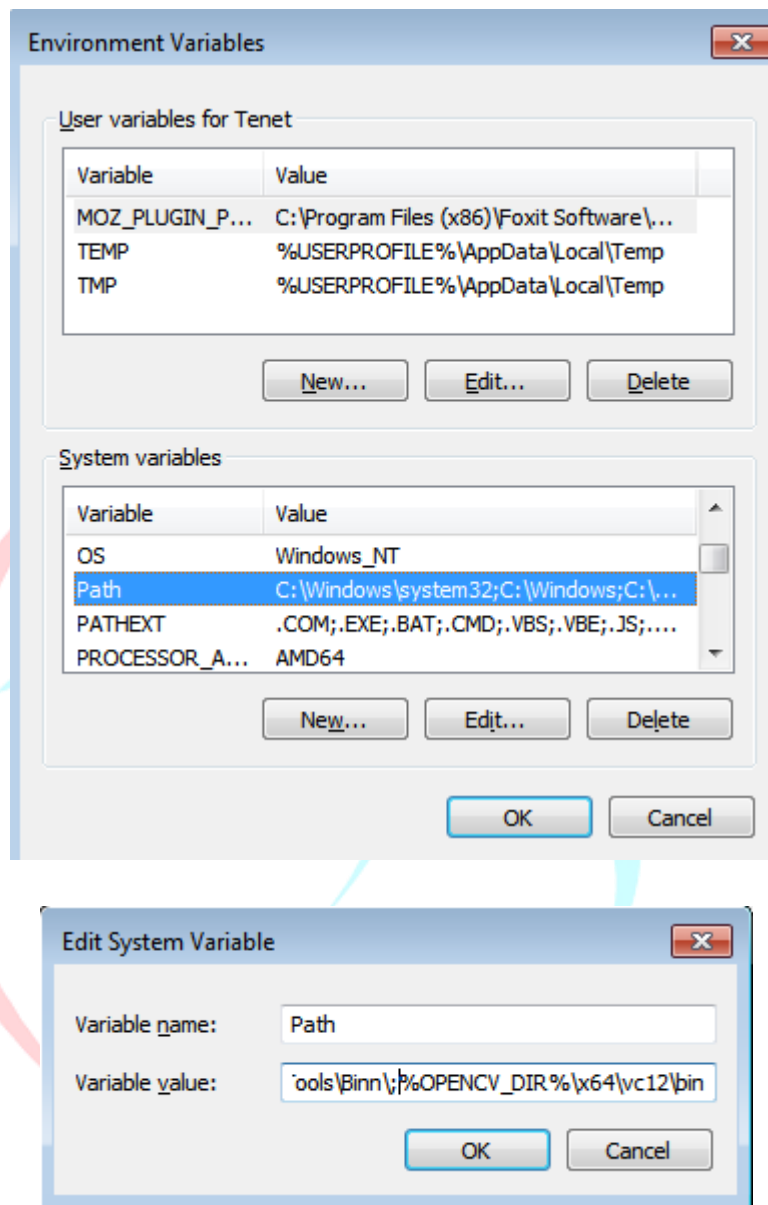

**Step 4:**

Select the new option on bottom of the window. And write the Variable name as **OPENCV\_DIR** and Variable value as path of Open CV where you installed. Select OK button.

**Step 5:**

Select the path option in the below window and copy the path of your Open CV as **%OPENCV\_DIR%\x64\vc12\bin** .Before doing this add ";"symbol in between.

#### MCP 3008 IC:

The MCP3008 10-bit Analog-to-Digital Converter (ADC) combines high performance and low power consumption in a small package, making it ideal for embedded control applications. The MCP3008 features a successive approximation register (SAR) architecture and an industry-standard SPI serial interface. The MCP3008 features 200k samples/second, 8 input channels, low power consumption (5nA typical standby, 425µA typical active), and is available in 16-pin PDIP and SOIC packages. Applications for the MCP3008 include data acquisition, instrumentation and measurement, multi-channel

data loggers, industrial PCs, motor control, robotics, industrial automation, smart sensors, portable instrumentation and home medical appliances.

**Pin diagram:**

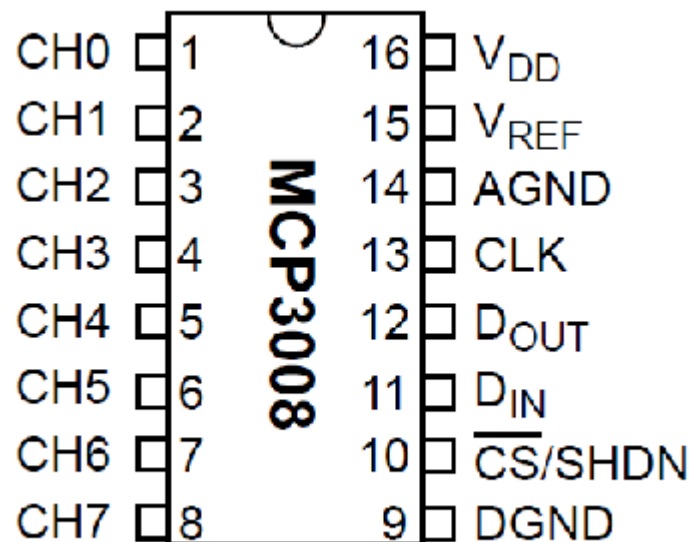

Figure 1

### **LDR (Light Dependent Resistor):**

A **Light Dependent Resistor** (LDR) or a photo resistor is a device whose resistivity is a function of the incident electromagnetic radiation. Hence, they are light sensitive devices. They are also called as photo conductors, photo conductive cells or simply photocells. They are made up of semiconductor materials having high resistance.

#### **Working Principle of LDR:**

A light dependent resistor works on the principle of photo conductivity. Photo conductivity is an optical phenomenon in which the materials conductivity (Hence resistivity) reduces when light is absorbed by the material.

#### **Tenet LDR breakout board:**

Figure 2

## SPI Interface:

The Serial Peripheral Interface (SPI) bus was developed by Motorola to provide full-duplex synchronous serial communication between master and slave devices. The SPI bus is commonly used for communication with flash memory, sensors, real-time clocks (RTCs), analog-to-digital converters, and more.

As shown in Figure , standard SPI masters communicate with slaves using the serial clock (SCK), Master Out Slave In (MOSI), Master In Slave Out (MISO), and Slave Select (SS) lines. The SCK, MOSI, and MISO signals can be shared by slaves while each slave has a unique SS line.

TECHNETRONICS

**Step 1:** Start by running the following command :

## Sudo raspi-config

**Step 2:** This will launch the raspi-config utility. Select option 8 “Advanced Options”.

```

##### Raspberry Pi Software Configuration Tool (raspi-config) #####
# Setup Options
#
# 1 Expand Filesystem           Ensures that all of the SD card storage
# 2 Change User Password       Change password for the default user (p
# 3 Enable Boot to Desktop/Scratch Choose whether to boot into a desktop e
# 4 Internationalisation Options Set up language and regional settings t
# 5 Enable Camera              Enable this Pi to work with the Raspber
# 6 Add to Rastrack            Add this Pi to the online Raspberry Pi
# 7 Overclock                  Configure overclocking for your Pi
# 8 Advanced Options          Configure advanced settings
# 9 About raspi-config         Information about this configuration to
#
#                               <Select>                               <Finish>
#####

```

Figure 4

**Step 3:** Select the “SPI” option.

```

##### Raspberry Pi Software Configuration Tool (raspi-config) #####
â Advanced Options
â
â   A1 Overscan                               You may need to configure overscan if b
â   A2 Hostname                             Set the visible name for this Pi on a n
â   A3 Memory Split                         Change the amount of memory made availa
â   A4 SSH                                  Enable/Disable remote command line acce
â   A5 SPI                                 Enable/Disable automatic loading of SPI
â   A6 Audio                                Force audio out through HDMI or 3.5mm j
â   A7 Update                              Update this tool to the latest version
â

Figure 8

**Step 7:** Reboot for the changes to take effect .

## Sudo reboot

- SPI is now enabled.

**Step 8:** In order to read data from the SPI bus in Python we can install a library called 'py-spidev'. To install it we first need to install 'python-dev' .

***Sudo apt-get install python2.7-dev***

**Step 9:** Then to finish we can download 'py-spidev' and compile it ready for use .

```
wget https://github.com/Gadgetoid/py-spidev/archive/master.zip
```

***unzip master.zip***

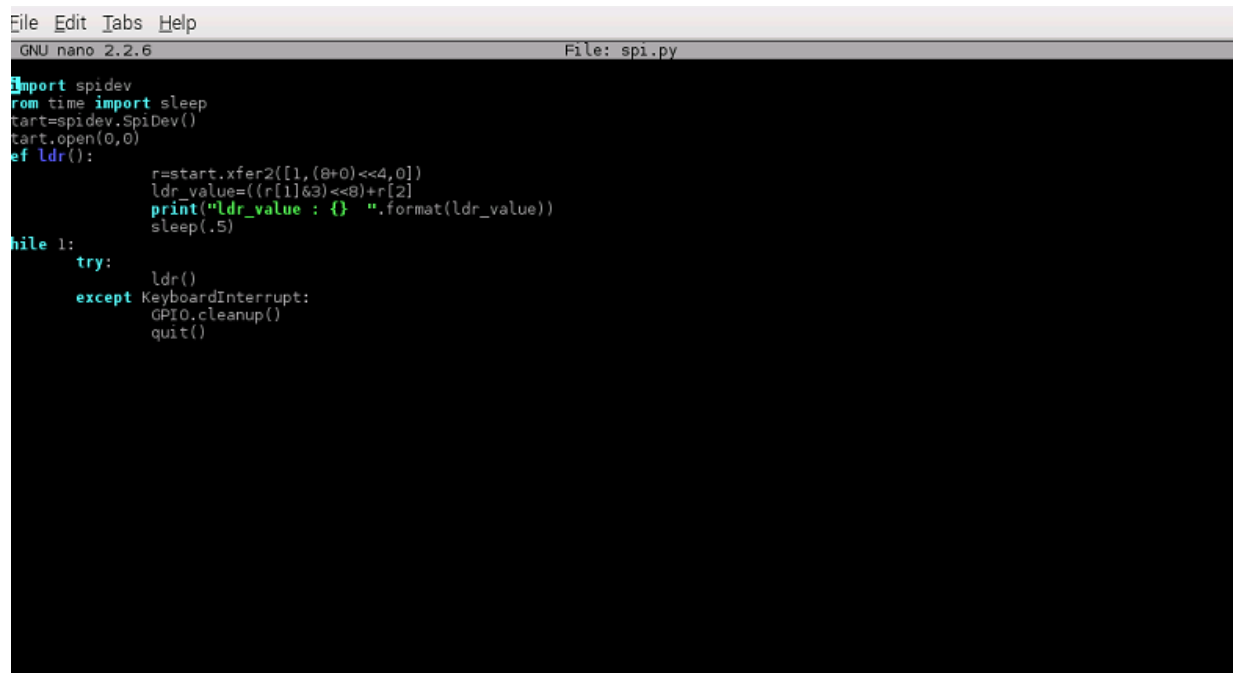

```
rm master.zip
```

```
cd py-spidev-master
```

```
sudo python setup.py install
```

```
cd ..
```

## Coding:

```
File Edit Tabs Help
GNU nano 2.2.6 File: spi.py

import spidev
from time import sleep
start=spidev.SpiDev()
start.open(0,0)
def ldr():
    r=start.xfer2([1,(8+0)<<4,0])
    ldr_value=((r[1]&3)<<8)+r[2]
    print("ldr_value : {}".format(ldr_value))
    sleep(.5)
while 1:
    try:
        ldr()
    except KeyboardInterrupt:
        GPIO.cleanup()
        quit()
```

Figure 9

Import spidev	//Importing spidev to access SPI
From time import sleep	//import sleep for giving delay
Start=spidev.SpiDev()	//creating object with name start
Start.open(0,0)	//(BUS,channel) since one channel and Bus
Def ldr():	//creating function
r=start.xfer2([1,(8+0)<<4,0])	//enabling SPI and 3 bytes of data stored in r
ldr_value=((r[1]&3)<<8)+r[2]	//Retrieving last 10 bit since MCP3008 is 10 bit
print("ldr_value : {}".format(ldr_value))	//printing ldr_value
while 1:	
try:	
ldr()	//function call
except KeyboardInterrupt:	//when CTRL+C is pressed terminate it
GPIO.cleanup()	
quit()
